The print features can be used without experience, but the format drop-downs are confusing and can only be filled in when a picture is open. They say that when you look at an image in print, that's the format that will be used. Too bad nobody else gets how complicated that is, and why it matters to have this information handy before you start. I should've reported this issue in the first review. I ran into several problems in Lightroom 5 where I could not fill-in the correct print format drop-down. It's not that the drop-downs are wrong. Instead, I'm referring to the fact that they cannot be filled in before a picture is imported or exported to be printed. Also, the print product itself cannot be added to a predefined drop-down without the filter for making that final decision. The same goes for batch printing using the Print command. I failed to understand how it works. I had virtually no experience with batch printing before the upgrade, except for a few times I had to come to the dark side by printing on CDRs. The configurable printing functionality was never particularly user-friendly and it did not really simplify my experience requesting prints, because entering a printer's profile was merely an additional task. You definitely cannot use the print functionality if the print options are missing. Other than a typically long and tedious workaround, you can't print a picture by selecting the Print option, choosing a location, and checking "Save this print for later." Not until the location is set, the format is selected and you've started the print will you be allowed to check the box. In other words, Lightroom's built-in printing seems to be much less well designed than it could be.
